

# Python APIs

Data Boot Camp  
Lesson 6.2

# The Big Picture

Module 6

# This Week: Python APIs

# This Week: Python APIs

---

By the end of this week, you'll know how to:

Perform tasks and write functions using new Python libraries and modules

Retrieve and use data from an API "get" request to a server

Retrieve and store values from a JSON array

Use try-except blocks to resolve errors

Create scatter plots using the Matplotlib library, and apply styles and features to a plot

Perform linear regression and add regression lines to scatter plots

Create heatmaps and add markers using the Google Maps API

## **This Week's Challenge**

Using the skills learned this week, add features to an existing weather application to allow users to enter input statements to filter data, create travel itineraries, and more.

## Module 6

# Today's Agenda

# Today's Agenda

---

By completing today's activities, you'll learn the following skills:

01

Google Maps API

02

Make sure you've downloaded  
any relevant class files!

## FIST TO FIVE:

---

How comfortable do you feel with this topic?

Time to Code

# Google Maps API

Suggested Time:

---

10 minutes

# Instructor Demonstration

---

## Google Geocode

**Remember:**

Printing the URL will also  
expose your key

# Google Geocode

---

Run a Python request on the URL.

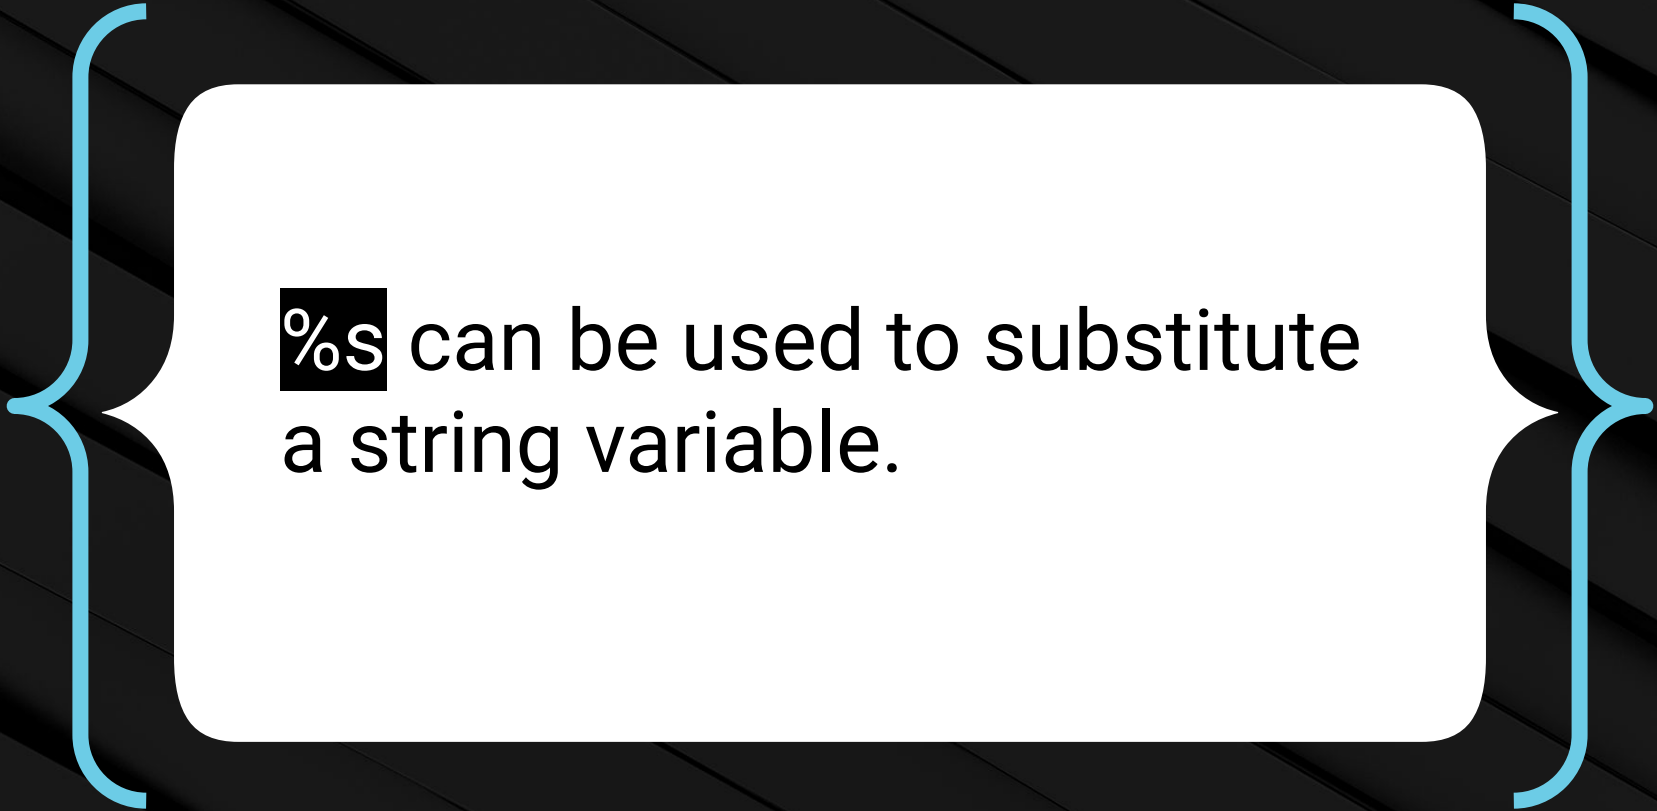

Explore the resulting JSON in a pretty-printed format.

Extract the desired components of the JSON: the latitude and longitude.

Format the results for printing.

`%s` can be used to substitute  
a string variable.

# Questions?

# Instructor Demonstration

---

## Google Places

# Google Places

---

**Nearby Search:** Searches for places within an area

```
https://maps.googleapis.com/maps/api/place/nearbysearch/output?parameters
```

**Text Search:** Returns info about a set of places based on a string

```
https://maps.googleapis.com/maps/api/place/textsearch/output?parameters
```

**Place Search:** Searches for place information based on category

```
https://maps.googleapis.com/maps/api/place/findplacefromtext/output?parameters
```

## Activity: Google Drills

In this activity, you will make calls to both the Google Places and Google Geocoding APIs.

**Suggested Time:**  
15 minutes

# Questions?

# Pandas with the Google API

During the last class, we learned  
how to make multiple queries  
and handle missing data using  
`try-except` and list comprehension

## Instructor Demonstration

---

# Nearest Restaurants

## **Activity:** Google Complex (Airport)

In this activity, you will be tasked with obtaining the user rating for every airport in the top 100 metropolitan areas. They will be given a list of airports and cities, and will need to use the Google Geocoding API and Google Places API to obtain the rating information.

**Suggested Time:**  
15 minutes

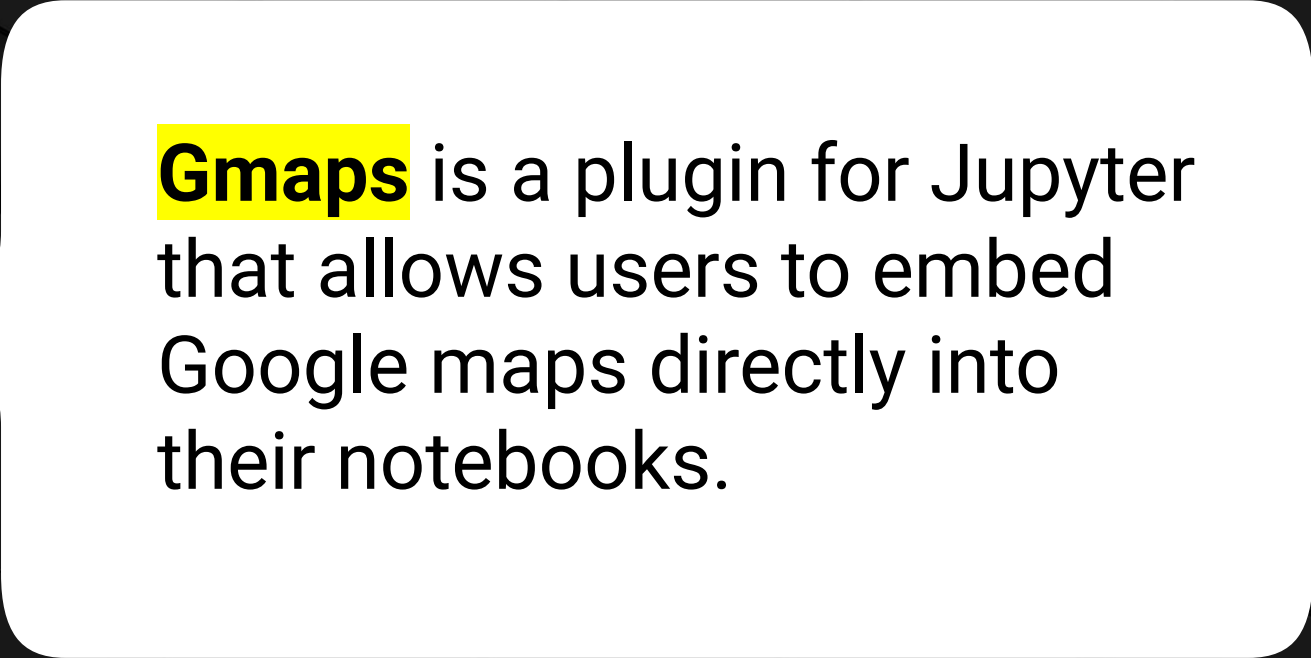

**Let's Review**

# Jupyter Gmaps

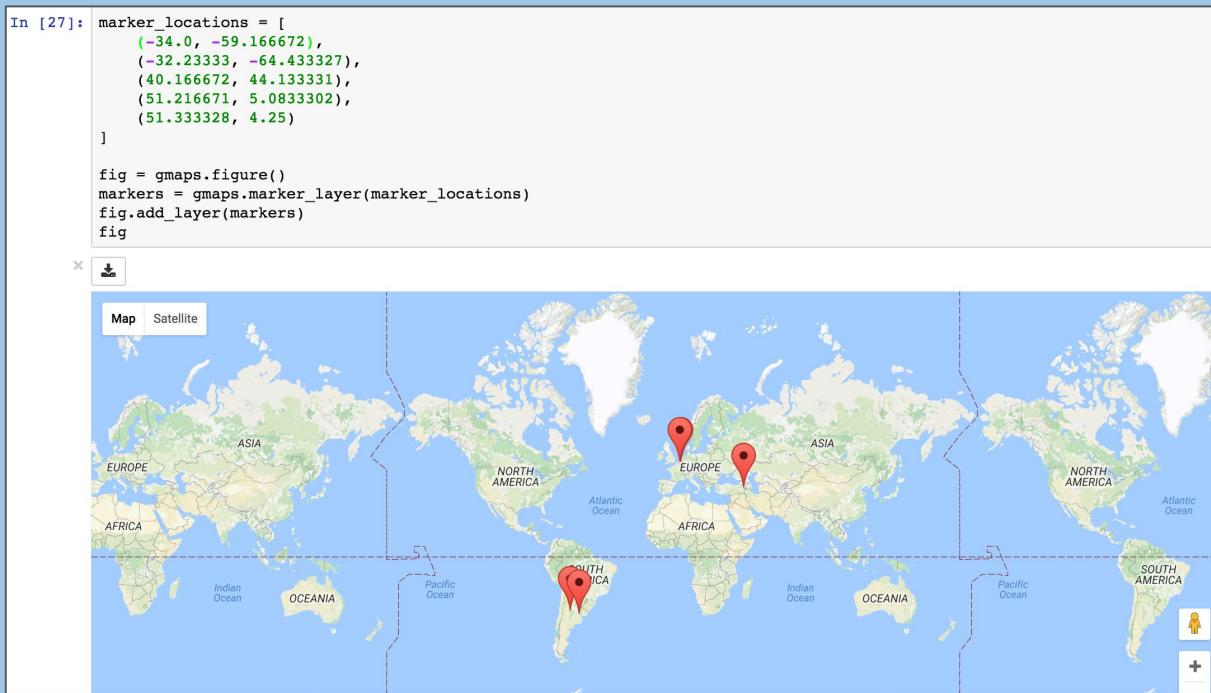

**Gmaps** is a plugin for Jupyter that allows users to embed Google maps directly into their notebooks.

# Jupyter Gmaps

This grants the ability to visualize multiple layers of data and to customize the appearance of the map.

# Time to Code

## Jupyter Gmaps

Suggested Time:

---

10 minutes

## **Activity:** Hot Airports

In this activity, you will be tasked with creating a heat map based on the airport ratings obtained in a previous activity.

**Suggested Time:**  
15 minutes

**Let's Review**

# Creating Direction Maps

Google's Directions API allows us to plot routes on maps.

# Time to Code

## Itinerary

Suggested Time:

---

15 minutes

# Questions?
